## **DECLARATION**

I hereby declare that this submission is my work for getting a master's degree in Epidemiology. And all that, to the best of my knowledge, contains material that is not previously published, nor material that has been accepted for taking any of other degrees in any other University, except where due information has been made in the text.

**Mohammed Saleh Saleh Abdullah**  
(Researcher)

## **CERTIFICATE**

This is to certify that this thesis entitled “**Prevalence of Typhoid Fever and Associated Factors among Restaurants’ Food Handlers in Sana'a City, Yemen**” which submitted to the department of Community Health and Nutrition, Faculty of Medical Sciences, Al-Razi University, for awarding a master degree in Epidemiology.

It is a record of the original and bona fide thesis work carried out by **Mohammed Saleh Saleh Abdullah** under my guidance. Such material as has been obtained from other sources has been duly acknowledged in the research.

This thesis embodies the work of the candidate himself and no part of it has been submitted for any other degrees.

Supervisor:

**Dr. Abdullah Abdul-Aziz Muharram**

Associate Professor of Community Medicine,

Faculty of Medicine and Health Sciences,

Sana'a University

## **DEDICATION**

I dedicated this work to my mother, the spirit of my father, and to my  
lovely wife.

## **ACKNOWLEDGMENT**

In the beginning, I wish to express my heartfelt gratitude to **Almighty God (ALLAH)** for His guidance and protection throughout my education without any mishap. I am equally indebted to my supervisor **Associate Professor Abdullah A. Muharram** for his overwhelming support through the study and for giving me useful advice to enrich this research. Furthermore, I am grateful to **Professor. Nabil Al-Rabeei** (the Vice University Rector for Postgraduate Studies), **Associate Professor Fawz Abol Ghaith**, and all of the other lecturers for their support. Also, special thanks go to the University of Science and Technology Hospital (USTH) for supporting me throughout this study and helping me to carry out the laboratory tests in the hospital.

Additional thanks go to Dr. Dalal, Dr. Walid, and Dr. Eyad in the hospital lab for their cooperation, and to all the food handlers who participated in this study and thus constituted the study population. My heartfelt gratitude also goes to my lovely wife, Mrs. Roqiah Yahia, for her support and relentless efforts. Thanks for her love and always being there for me. Indeed, her heart is made of gold. Finally, to all those who contributed in diverse ways to help me carry out this work, lack of time would not permit me to detail all your names, I, therefore, say a big thank you to you, and may God bless you all.

68	Z	Standard normal deviation

## **ABSTRACT**

### **Background of the study:**

Typhoid Fever remains a crucial public health issue around the globe, especially in developing countries. The high carrier rate of Salmonella Typhoid in food handlers working in restaurants and other food establishments may contribute to the constant high Typhoid Fever prevalence rate in developing countries.

### **The objective of the study:**

The current study aimed at determining the prevalence of Typhoid Fever and associated factors among restaurants food handlers in Sana'a City, Yemen.

### **Research methodology:**

A cross-sectional study was carried out, using questionnaires, observational checklists, and blood and stool samples which were collected randomly from 123 of the restaurants' food handlers from 25<sup>th</sup> of August 2020 to 25<sup>th</sup> of December, 2020.

### **Results:**

The isolate prevalence and Widal seroprevalence of Typhoid Fever (Salmonella Typhi) among restaurants food handlers in Sana'a City were (0.8%), and (13%) respectively. Poorly adherence to medical examination was (99.2%), (71.5%) knew nothing about Typhoid Fever, (99.2%) had poor knowledge about Typhoid Fever transmission, (54.5%) of them had none treated sources of drinking water, (55.3%) of the toilets were not clean, (83.7%) of restaurants' washing basins with no soap or detergent, of the floor tiles (68.3%) were dirty and cracked. Furthermore, (43.9%) with inadequate personal hygiene, only (35.8%) with good behaviors,

(25.2%) had personal or family history of TF, (17.1%) had symptoms of TF, (23.6%) had poor kitchen status, (35.8%) with poor WASH and restaurants condition. Mainly, the Salmonella Typhoid isolate-prevalence associated factors were geographical distributional zones, with a  $p$ -value of (0.022). Additionally, the Salmonella Typhoid Widal seroprevalence associated factors were Typhoid knowledge, family history, trash collection beside the restaurant, and the dirty and cracked restaurants floor tiles, with  $p$ -values of (0.009), (0.028), (0.025), and (0.024) respectively.

### **Conclusion and recommendations:**

Typhoid Fever is prevalent among food handlers and it was statistically significantly associated with Sana'a City geographical zones, knowledge regarding Typhoid, family history, trash collection beside the restaurant, and dirty cracked floor tiles. Further researches on a wider range, obligatory admission conditions, educational courses, periodical medical checkups, and continuous evaluation of the health requirements implementation in restaurants are recommended.
